# ThickWallCylinder

### 1 介绍

ThickWallCylinder用来计算厚壁圆筒受内外压下的应力。

### 2 原理

极坐标下厚壁圆筒受内外压作用下的应力可以写为:

$$A = a^2 b^2 \frac{P_b - P_a}{b^2 - a^2} \tag{1}$$

$$B = 0 (2)$$

$$C = \frac{P_a a^2 - P_b^2 b^2}{2(b^2 - a^2)} \tag{3}$$

径向和环向应力为:

$$\sigma_{\rho} = \frac{A}{\rho^2} + B(1 + 2ln\rho) + 2C \tag{4}$$

$$\sigma_{\phi} = -\frac{A}{\rho^2} + B(3 + 2ln\rho) + 2C \tag{5}$$
