## 1 介绍

RotatingDisc 用来计算旋转圆盘下应力分析。

### 2 原理

等厚旋转圆盘以等角速度 $\omega$ 绕其中心轴转动,若材料的密度为ho,圆盘的应力分量为

$$\sigma_{\rho} = \frac{3+\mu}{8}\rho\omega^{2}(R_{o}^{2} + Ri^{2} - \frac{Ro^{2}R_{i}^{2}}{r^{2}} - r^{2})$$

$$\tag{1}$$

$$\sigma_{\phi} = rac{3+\mu}{8}
ho\omega^{2}(R_{o}^{2}+Ri^{2}+rac{Ro^{2}R_{i}^{2}}{r^{2}}-rac{1+3\mu}{3+\mu}r^{2})$$

### 3 类结构

#### 输入 input:

• Location: 计算位置

v:泊松比Rho:密度

• Omega: 转速 RPM

• Ro: 外圆半径

• Ri: 内圆半径

#### 参数 params:

• Name : 名称

输出 output:

• Stress:应力结果

### 4 案例

### 4.1 Rotating disc analysis (Flag=1)

```
inputStruct.Ri=140;
inputStruct.Ro=500;
inputStruct.Omega=5000;
inputStruct.Location=140;
paramsStruct=struct();
C=method.RotatingDisc(paramsStruct, inputStruct);
C=C.solve;
disp(C.output.Stress);
PlotStress(C)
```

Successfully calculate rotating disc stress.
