Dome

Xie Yu

1 介绍

Dome类用于绘制薄壁穹顶结构,它可以根据曲线旋转生成穹顶。

2 类结构

输入 input:

• Meshsize:单元尺寸

• Thickness:厚度

• Curve:曲线

参数 params:

• Order: 单元阶数

• Name: 名称

• E_Revolve: 壳单元旋转方向网格划分数量

• Offset:偏移位置

• Material:材料

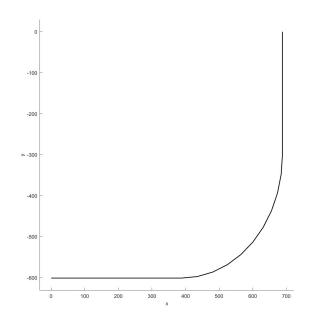

输出 output:

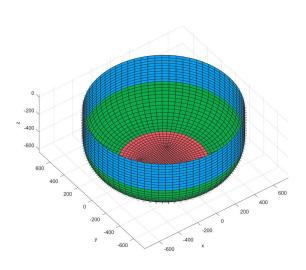

- Assembly: 売单元装配
- ShellMesh: 壳网格

3 案例

3.1 Dome1 (Flag=1)

```
1
    a=Point2D('PointAss');
    b=Line2D('LineAss');
    a=AddPoint(a,[0;1376/2],[-601;-601]);
 4
    a=AddPoint(a,[1376/2;1376/2],[-601;0]);
 5
    b=AddLine(b,a,1);
    b=AddLine(b,a,2);
 7
    b=CreateRadius(b,1,300);
 8
    Plot(b);
 9
    inputStruct.Curve=b;
10
    inputStruct.Thickness=repmat(8,size(b.Point.PP,1),1);
11
    inputStruct.Meshsize=30;
12
    paramsStruct.Offset="TOP";
13
    obj= dome.Dome(paramsStruct, inputStruct);
14
    obj= obj.solve();
   Plot3D(obj,'face_normal',1);
15
```

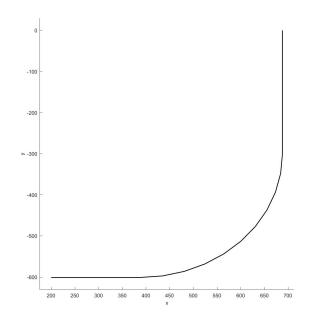

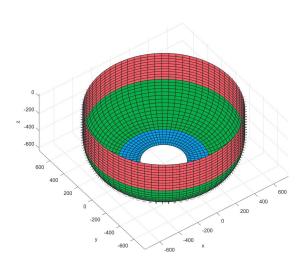

3.2 **Dome2** (Flag=2)

```
1  a=Point2D('PointAss');
2  b=Line2D('LineAss');
3  a=AddPoint(a,[1376/2;1376/2],[0;-601]);
4  a=AddPoint(a,[1376/2;200],[-601;-601]);
5  b=AddLine(b,a,1);
6  b=AddLine(b,a,2);
7  b=CreateRadius(b,1,300);
8  Plot(b);
9  inputStruct.Curve=b;
```

```
inputStruct.Meshsize=30;
paramsStruct.Offset="TOP";
obj= dome.Dome(paramsStruct, inputStruct);
obj= obj.solve();
Plot3D(obj,'face_normal',1);
```
